PROPAGATION & VEGETATIVE PHASE

Calandiva® Decorative

Kalanchoe blossfeldiana

MEDIA

Rooting Hormone? **No**

Direct Stick Instructions Fill and saturate containers, wait for at least half a day before sticking,

keep media as dry as possible for 6-8 days after stick.

FERTILITY

Fertilizer Rate 50-75ppm N with 20-10-20 (when roots begin to form)

Long-Day EC Range 0.6-1.0 mS via SME pH Range 5.5-6.0 (Ideally 5.8)

TEMPERATURE

Average Soil Temperature 68°F (20°C)

Average Air Temperature 68-72°F (20-22°C)

IRRIGATION

Irrigation Frequency (after day 14) Level 3 (keep media moderately moist at all times)

LIGHT

Vegetative Photoperiodic

Requirements

Long Day

Supplemental To maintain vegetative growth: 14-18 hours daily or night interruption

starting 2-3 hours after sunset and ending 2-3 hours before sunrise.

The long-day phase should last between 6-10 weeks after stick depending on container size and cultivar vigor (General rule of thumb, apply long days

until the plant is 2/3 the desired height).

Benefits From Shade? When transitioning out of prolonged low-light conditions, start shading at

4200 fc (45000 lux). During high-light months, shading must be applied at

5500 fc (59200 lux) or as-needed for cooling.

POTENTIAL DISEASES AND DISORDERS

Botrytis, Pythium, powdery mildew, Fusarium, Phytophthora, oedema/edema

POTENTIAL PESTS

Aphids, fungus gnats, mites, thrips

PGR SUGGESTIONS

- Daminozide (85%) at 2500ppm using an ultra-fine (mist) nozzle. Only one spray in propagation at 3rd week of long days.
- Daminozide (85%) at 2000-2500 ppm + Chlormequat (11.8%) at 1000ppm tank mix using an ultra-fine (mist) nozzle to substitute Daminozide-only application.
- Chlormequat (11.8%) at 2000 ppm as an alternative to Daminozide for slow growing cultivars. Apply at 2nd week of the long days.

TIPS

- Bottom heat is suggested to speed rooting and stabilize media temperature. Ensure media temperature does not surpass ambient air temperature.
- Avoid sudden changes to the growing environment; any necessary adjustments should be gradual.
- Avoid use of oil-based liquid chemicals unless otherwise advised by Dümmen Orange.
- European growers oftentimes apply Propiconazole (41.8%) at 2-4ppm the 3rd or 4th week of long days. Although primarily used as a fungicide, one treatment can be applied to control leaf size on large-leafed cultivars.

FLOWERING PHASE

Calandiva® Decorative

Kalanchoe blossfeldiana

Fertilizer Rate 100-200 ppm N with 20-10-20 plus additional micronutrients

Short Day EC Range **0.8-1.3 mS via SME**

Finish Flowering EC Range 0.8-1.1 mS via SME

pH Range **5.5-6.1 (ideally 5.8)**

TEMPERATURE

Day Temperature **68-74°F (20-23°C)**Night Temperature **66-70°F (19-21°C)**

IRRIGATION

Irrigation Frequency Level 3 (keep media moderately moist at all times)

Humidity **70-90% (Ideally 85%)**

LIGHT

Flowering Photoperiodic

requirements

Short Day

Photoperiodic Instructions Minimum 14 hours of darkness for 7 weeks minimum (black out conditions)

Supplemental Optional on cloudy days

Benefits From Shade? When transitioning out of prolonged low-light conditions, start shading at 4200 fc

(45000 lux). During high-light months, shading must be applied at 5500 fc (59200

lux) or as-needed for cooling.

POTENTIAL DISEASES AND DISORDERS

Botrytis, Pythium, powdery mildew, Fusarium, Phytophthora, oedema/edema

POTENTIAL PESTS

Aphids, fungus gnats, mites, thrips

PGR SUGGESTIONS

- Daminozide (85%) at 2000-2500ppm + Chlormequat (11.8%) at 1000ppm tank mix 3rd or 4th week of short days. After this initial tank-mix application, transition to a Daminozide only regimen.
- Daminozide (85%) at 2500-4000ppm: (6-10 day summer rotation) (8-12 day spring/autumn rotation) (10-15 day winter rotation). Start after initial tank mix application.
- Paclobutrazol (0.4%) at 2-4ppm only in emergency situations or long holding periods.

TIPS

- If you can read a newspaper under blackout, it's not dark enough. Streetlights, moonlight, etc should be taken into account to reduce the chance of short day interruption.
- Avoid overhead watering in general but especially during short days. Never use cold water, always 55°F (13°C) and warmer.
- Maintain a lower EC range when daytime temperatures are above 76°F (24°C).
- Stretching is primarily caused by humidity above 90% and/or a fluctuation of 30% or more.
- \bullet A red coloration on the underside of leaves indicates the crop is being kept too dry, too cold (below 62°F [17°C]) or is stressed in another regard.
- Kalanchoes are very sensitive to ethylene. A buildup of more than 0.1ppm should be avoided. Keep this in mind when shipping.
